# Relational Algebra & Query Evaluation

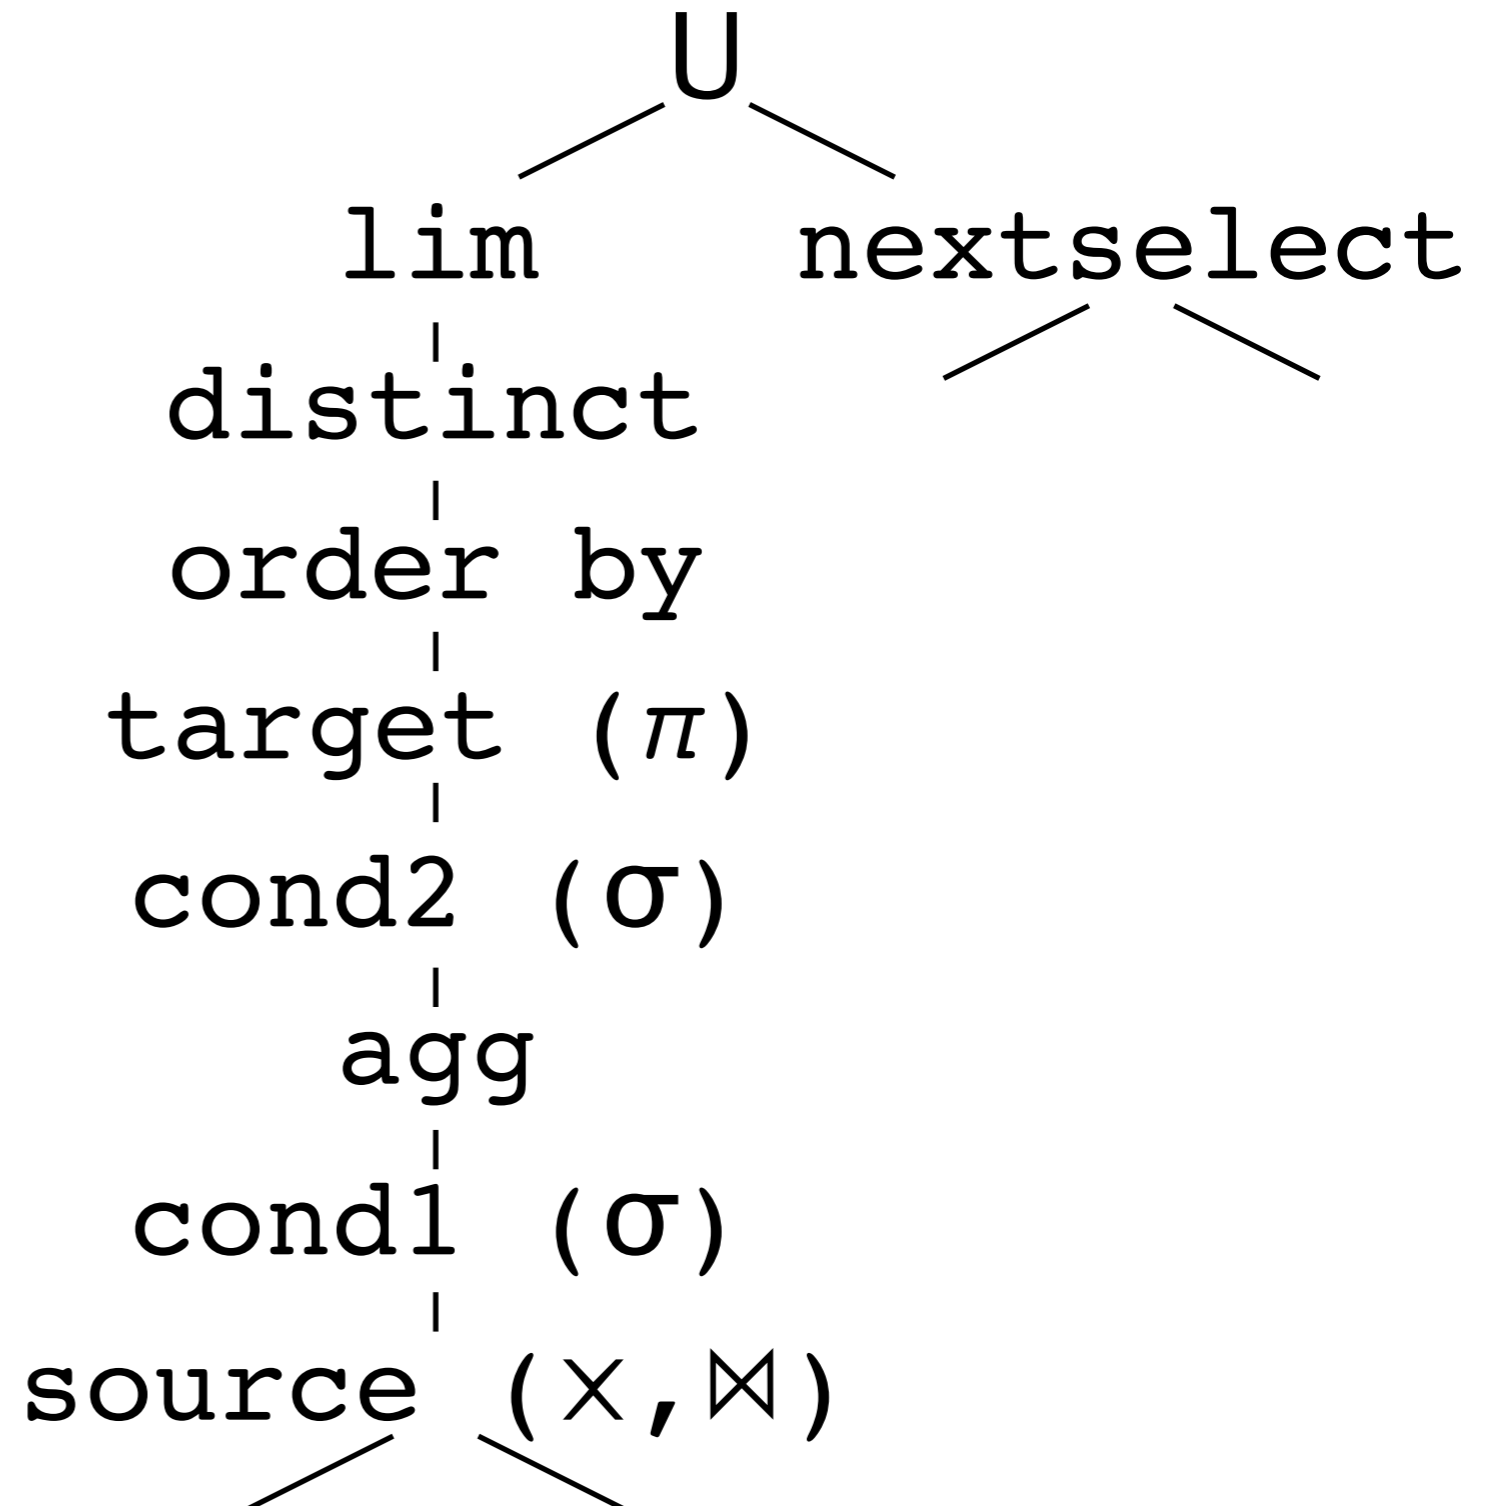

# Relational Algebra

Operation	Sym	Meaning
Selection	$\sigma$	Select a subset of the input rows
Projection	$\pi$	Delete unwanted columns
Cross-product	$\times$	Combine two relations
Set-difference	-	Tuples in Rel 1, but not Rel 2
Union	$\cup$	Tuples either in Rel 1 or in Rel 2

**Also:** Intersection, **Join**, Division,  
Renaming (Not essential, but very useful)

# SQL to RA

```
SELECT [DISTINCT]
      target
FROM source
WHERE cond1
GROUP BY ...
HAVING cond2
ORDER BY order
LIMIT lim
UNION nextselect
```

# GetNext()

## Relation

Read One Line from File

Split Line into Fields

Parse Field Types

Return Tuple

**What is the Working Set Size?**

# GetNext()

Projection ( $\pi$ )

Read One Tuple

Compute Projected Attributes

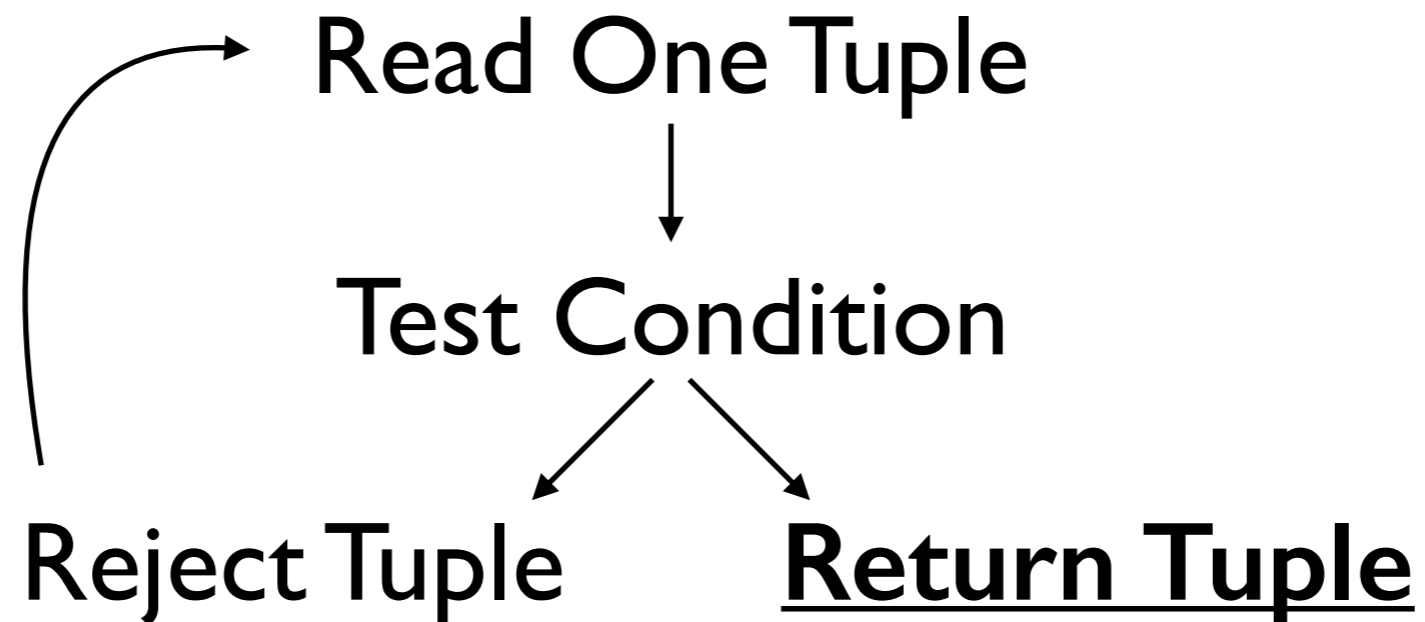

Return Tuple

**What is the Working Set Size?**

# GetNext()

## Selection ( $\sigma$ )

**What is the Working Set Size?**

# GetNext()

## Union (U)

Read One Tuple from R

R Empty?

Read One Tuple from S → Return Tuple

**What is the Working Set Size?**

# GetNext()

## Nested Loop Join/Cross (X)

Is there a saved tuple?

Read (and save) One Tuple from R

N

Read One Tuple from S

Y

S Empty?

Construct Joint Tuple

Reset S (Close(), Open())

From S and last read from R

Return Tuple

**What is the Working Set Size?  
but...**

# Memory Conscious Algorithms

- Join
  - NLJ has a small working set (but is slow)
- GB Aggregate
  - Working Set  $\sim$  # of Groups
- Sort
  - Working Set  $\sim$  Size of Relation

# Implementing: Joins

## Solution I (Nested-Loop)

For Each (a in A) { For Each (b in B) { emit (a, b); }}

A

B

# Implementing: Joins

## Solution 2 (Block-Nested-Loop)

1) Partition into Blocks

2) NLJ on each pair of blocks

# Implementing: Joins

## Solution 3 (Index-Nested-Loop)

Like nested-loop, but use an index to make the inner loop much faster!

# Implementing: Joins

## Solution 4 (Sort-Merge Join)

Keep iterating on the set with the lowest value.

When you hit two that match, emit, then iterate both

# Implementing: Joins

## Solution 5 (2-Pass Hash)

- 1) Build a hash table on both relations
- 2) In-Memory Nested-Loop Join on each hash bucket

# Implementing: Joins

## Solution 6 (1-Pass Hash)

Keep the hash table in memory

(Essentially a more efficient nested loop join)

# Relational Algebra Rewrites

# RA Equivalencies

## Selection

$$\sigma_{c_1 \wedge c_2}(R) \equiv \sigma_{c_1}(\sigma_{c_2}(R)) \quad (\text{Decomposable})$$

$$\sigma_{c_1 \vee c_2}(R) \equiv \delta(\sigma_{c_1}(R) \cup \sigma_{c_2}(R)) \quad (\text{Decomposable})$$

$$\sigma_{c_1}(\sigma_{c_2}(R)) \equiv \sigma_{c_2}(\sigma_{c_1}(R)) \quad (\text{Commutative})$$

## Projection

$$\pi_a(R) \equiv \pi_a(\pi_{a \cup b}(R)) \quad (\text{Idempotent})$$

## Cross Product (and Join)

$$R \times (S \times T) \equiv (R \times S) \times T \quad (\text{Associative})$$

$$(R \times S) \equiv (S \times R) \quad (\text{Commutative})$$

**Try It:** Show that  $R \times (S \times T) \equiv T \times (R \times S)$

# Selection and Projection

$$\pi_a(\sigma_c(R)) \equiv \sigma_c(\pi_a(R))$$

Selection commutes with Projection  
(but only if attribute set **a** and condition **c** are *compatible*)

**a** must include all columns referenced by **c**

Show that

$$\pi_a(\sigma_c(R)) \equiv \pi_a(\sigma_c(\pi_{a \cup \text{cols}(c)}(R)))$$

When is this rewrite a good idea?

# Join

$$\sigma_c(R \times S) \equiv R \bowtie_c S$$

Selection combines with Cross Product  
to form a Join as per the definition of Join

(Note: This only helps if we have a join algorithm for conditions like **c**)

Show that

$$\sigma_{(R.B=S.B) \wedge (R.A>3)}(R \times S) \equiv \sigma_{(R.A>3)}(R \bowtie_{(R.B=S.B)} S)$$

When is this rewrite a good idea?

# Selection and Cross Product

$$\sigma_c(R \times S) \equiv (\sigma_c(R) \times S)$$

Selection commutes with Cross Product  
(but only if condition **c** references attributes of R exclusively)

Show that

$$\sigma_{(R.B=S.B) \wedge (R.A>3)}(R \times S) \equiv \sigma_{(R.A>3)}(R) \bowtie_{(R.B=S.B)} S$$

When is this rewrite a good idea?

# Projection and Cross Product

$$\pi_a(R \times S) \equiv (\pi_{a_1}(R)) \times (\pi_{a_2}(S))$$

Projection commutes (distributes) over Cross Product  
(where  $\mathbf{a}_1$  and  $\mathbf{a}_2$  are the attributes in  $\mathbf{a}$  from R and S respectively)

Show that

$$\pi_a(R \bowtie_c S) \equiv (\pi_{a_1}(R)) \bowtie_c (\pi_{a_2}(S))$$

(under what condition)

How can we work around this limitation?

$$\pi_a\left(\left(\pi_{a_1 \cup (\text{cols}(c) \cap \text{cols}(R))}(R)\right) \bowtie_c \left(\pi_{a_2 \cup (\text{cols}(c) \cap \text{cols}(S))}(S)\right)\right)$$

When is this rewrite a good idea?

# RA Equivalencies

Union and Intersections are Commutative and  
Associative

Selection and Projection both commute  
with both Union and Intersection

When is this rewrite a good idea?

# Index Design / Selection

# Indexes

Clustered Index

Unclustered Index  
(Secondary Index)

# Indexes

# Access Paths

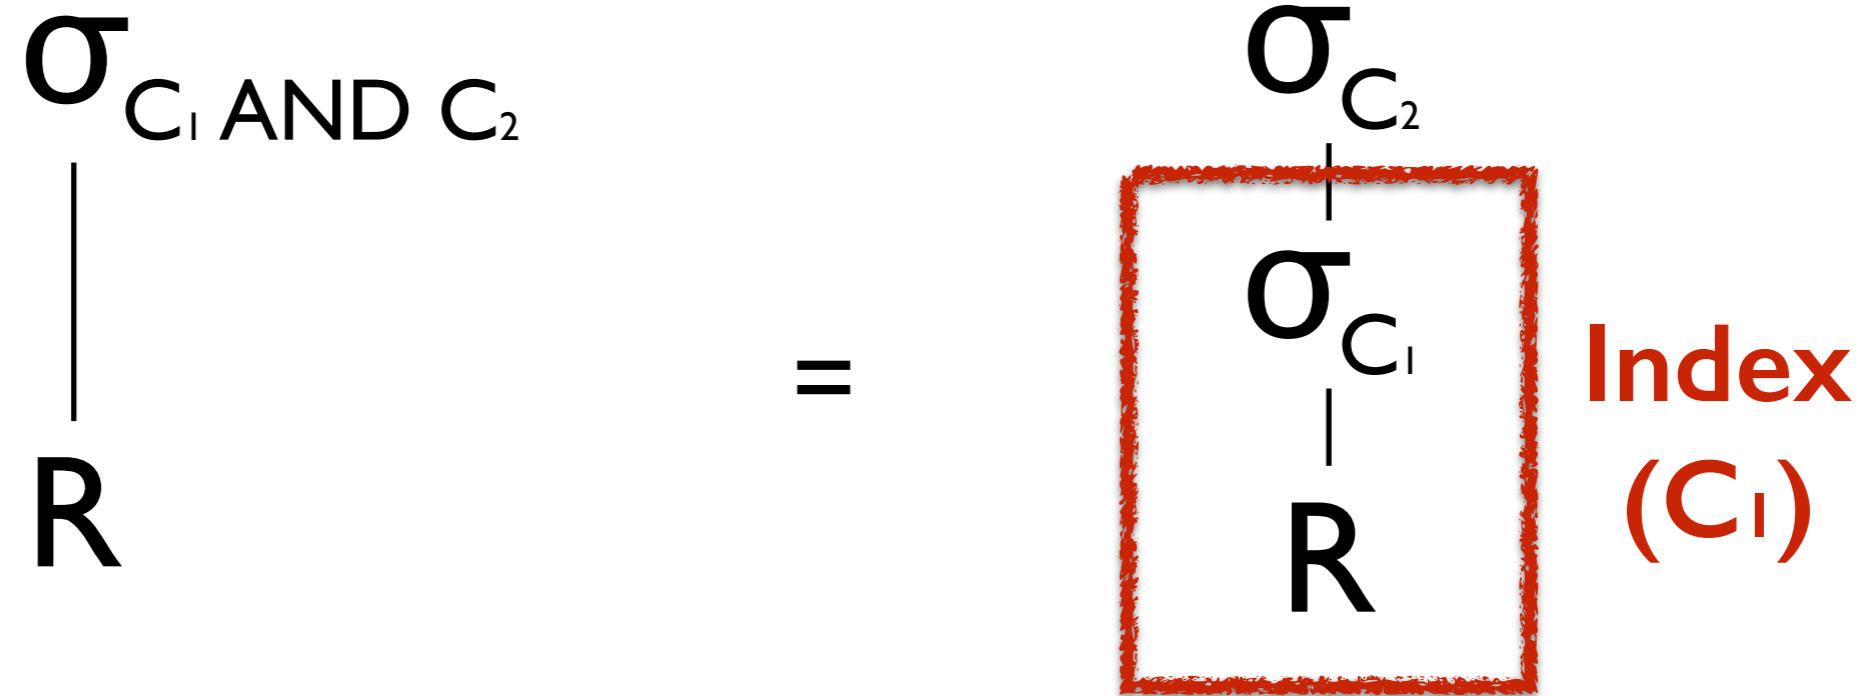

$$\sigma_{C_1 \text{ AND } C_2}$$

|

$$R$$

Can we “simplify” this condition

# Access Paths

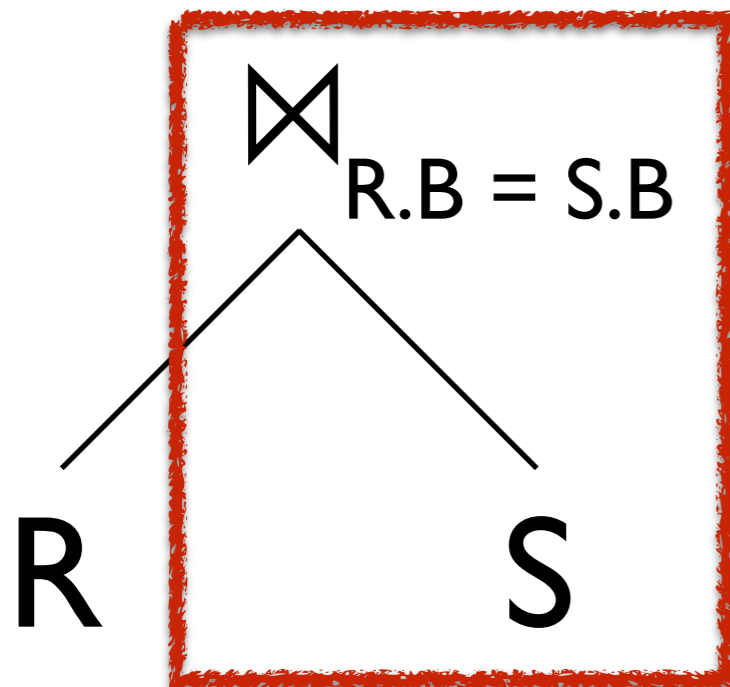

# Access Paths

**Index**  
 **$A \in (1, 10)$**

# Access Paths

How could we compute this  
If we had an index on S.B?

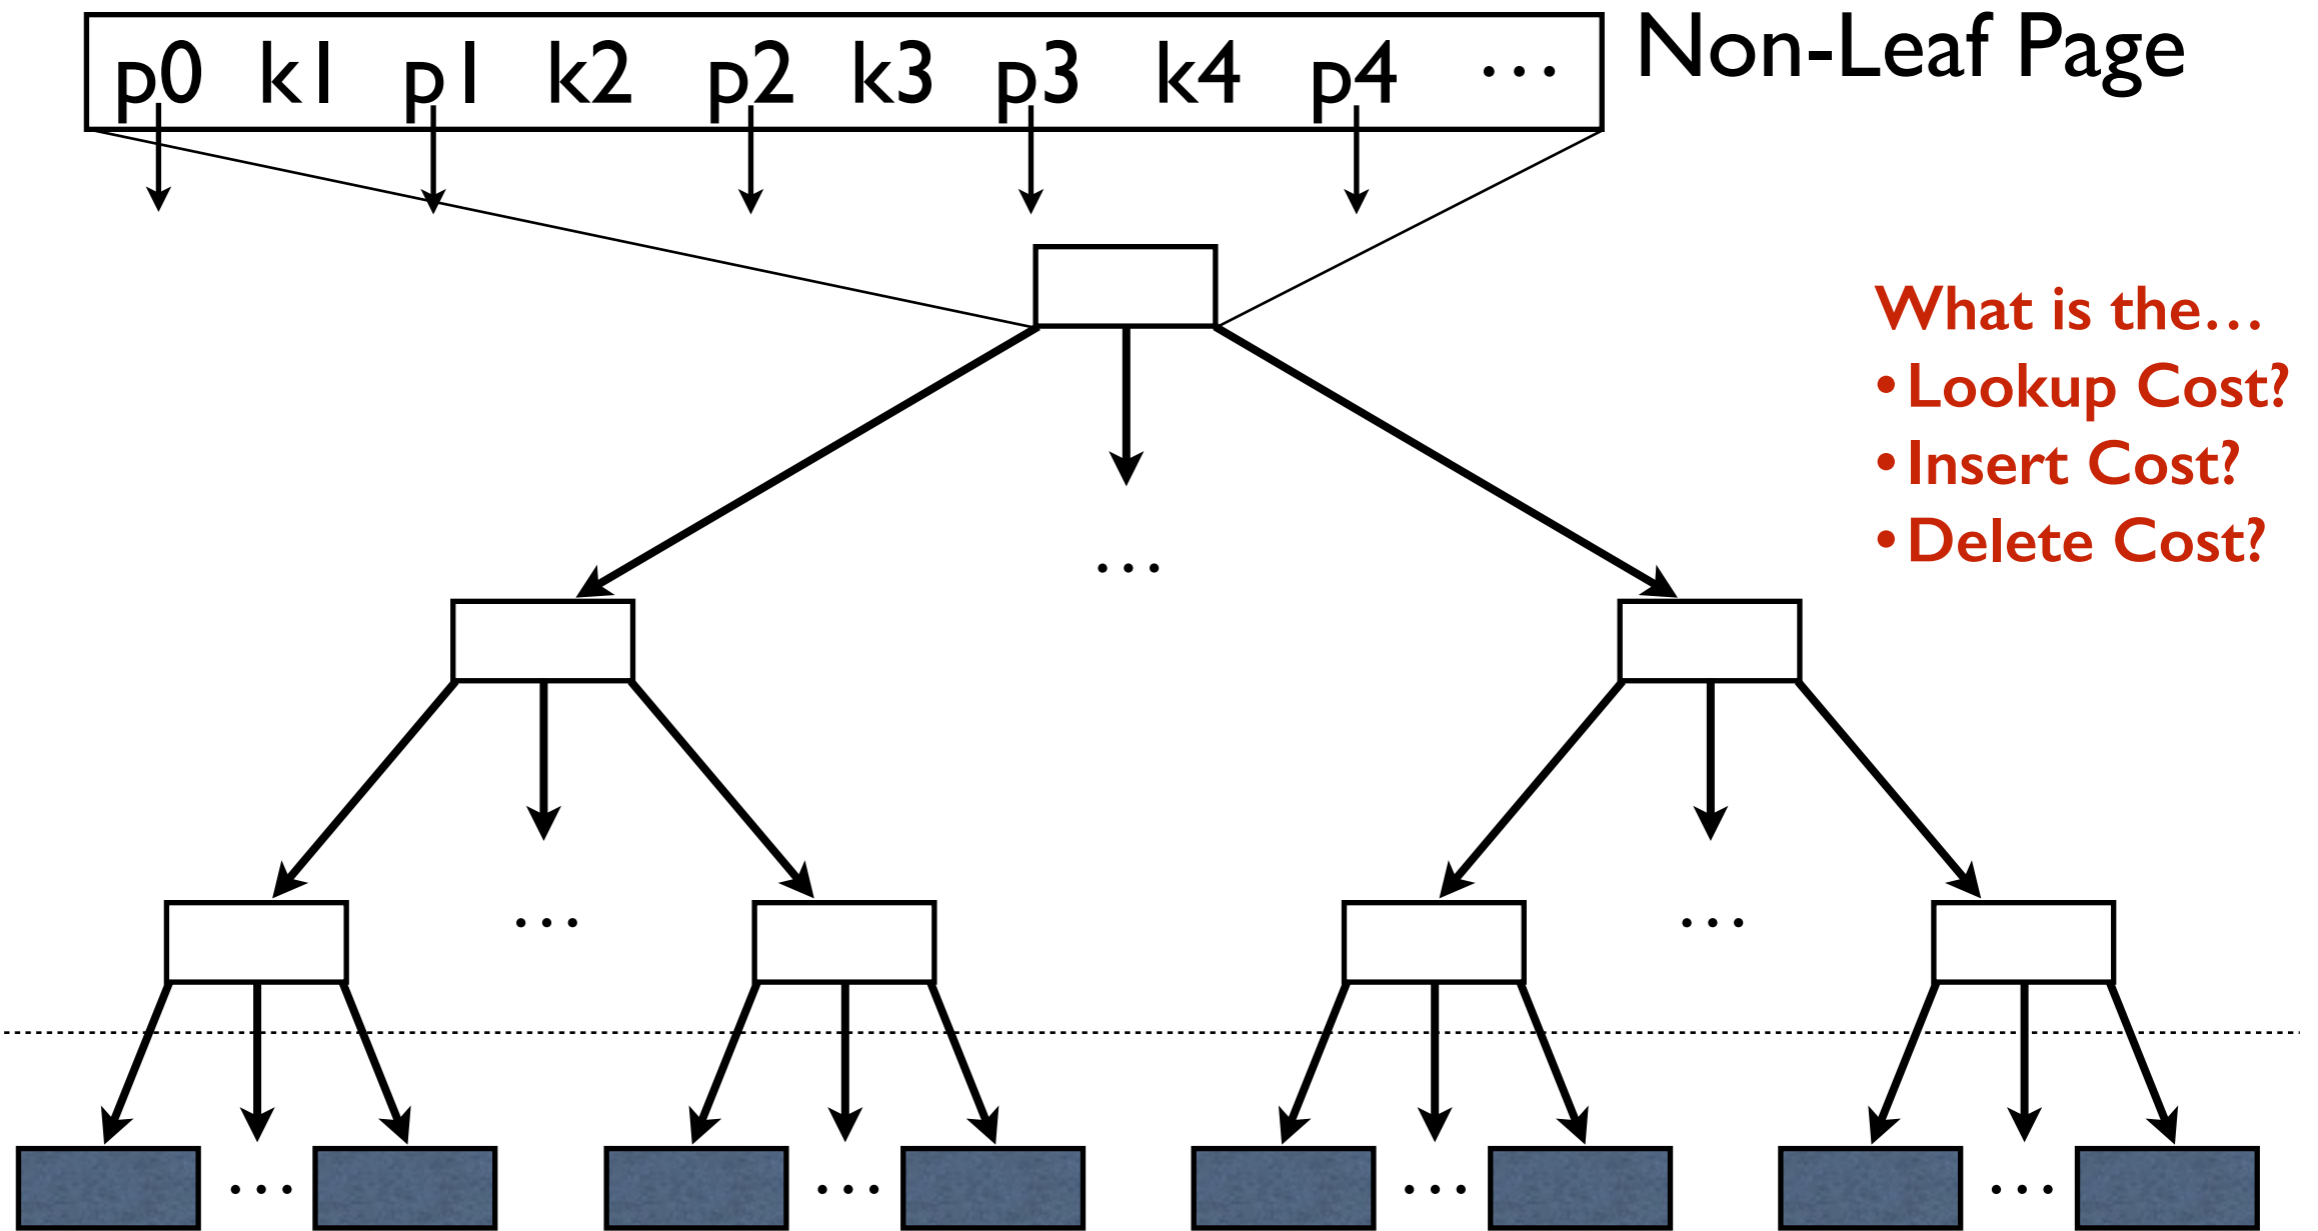

```
Foreach r in R
  Foreach s in
    IndexLookup(S, B=r.b)
  Emit(r x s)
```

What are the Working Set Size & IO Cost?

# The ISAM Datastructure

Non-Leaf Pages

Leaf Pages

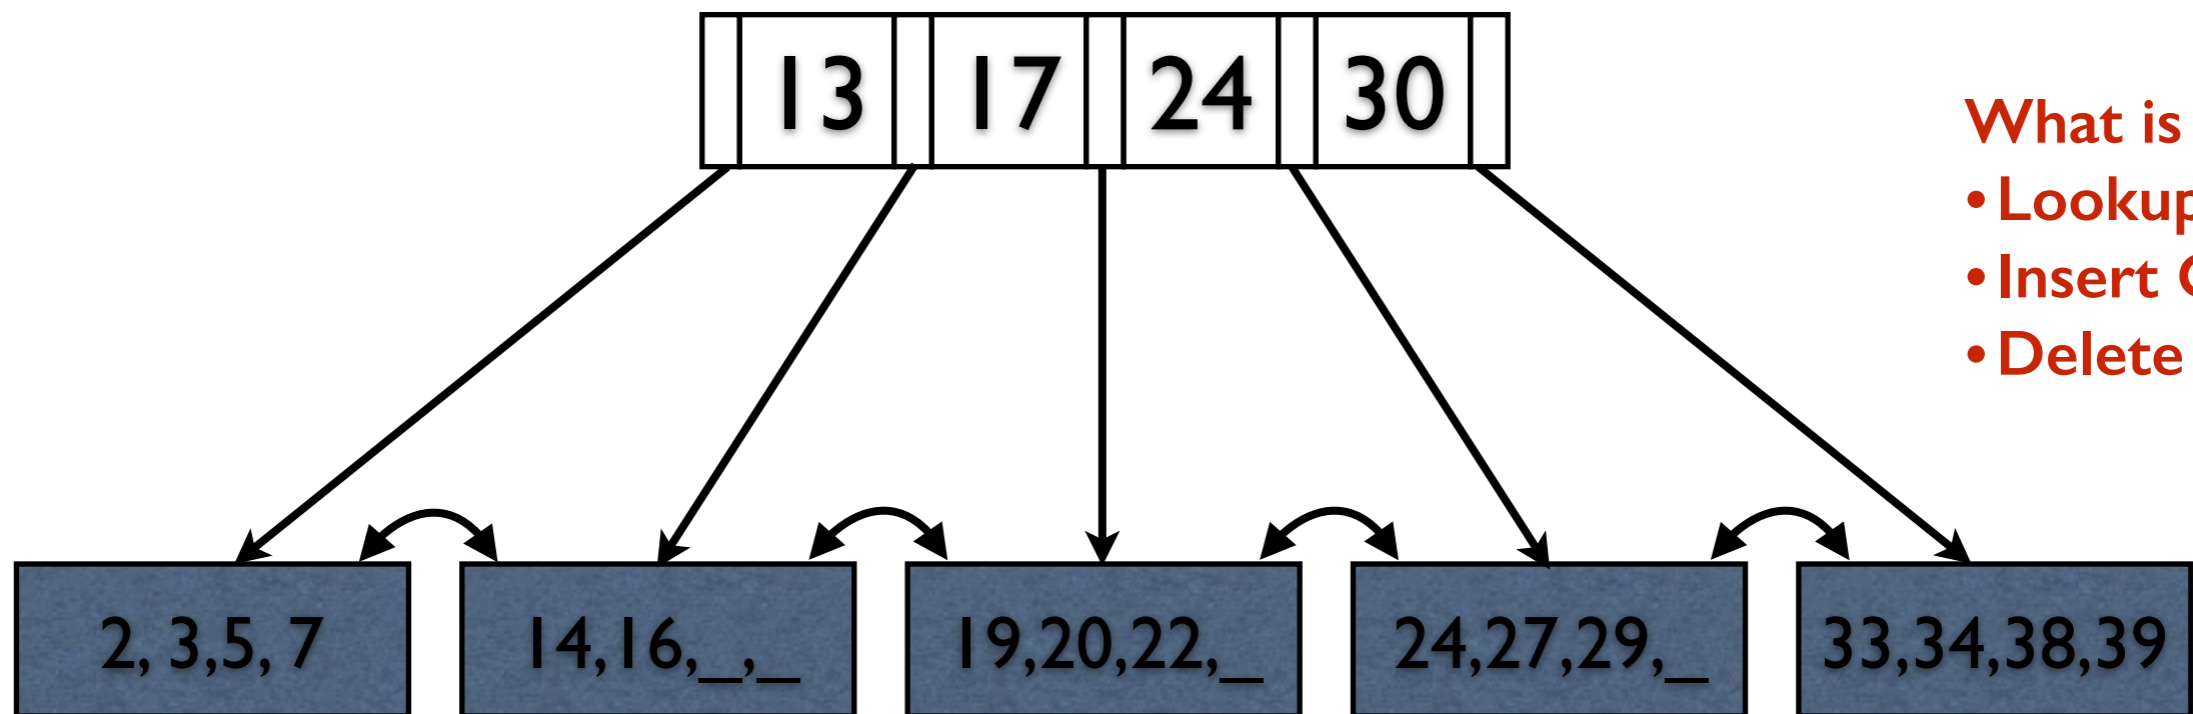

What is the...  
• Lookup Cost?  
• Insert Cost?  
• Delete Cost?

# B+ Trees

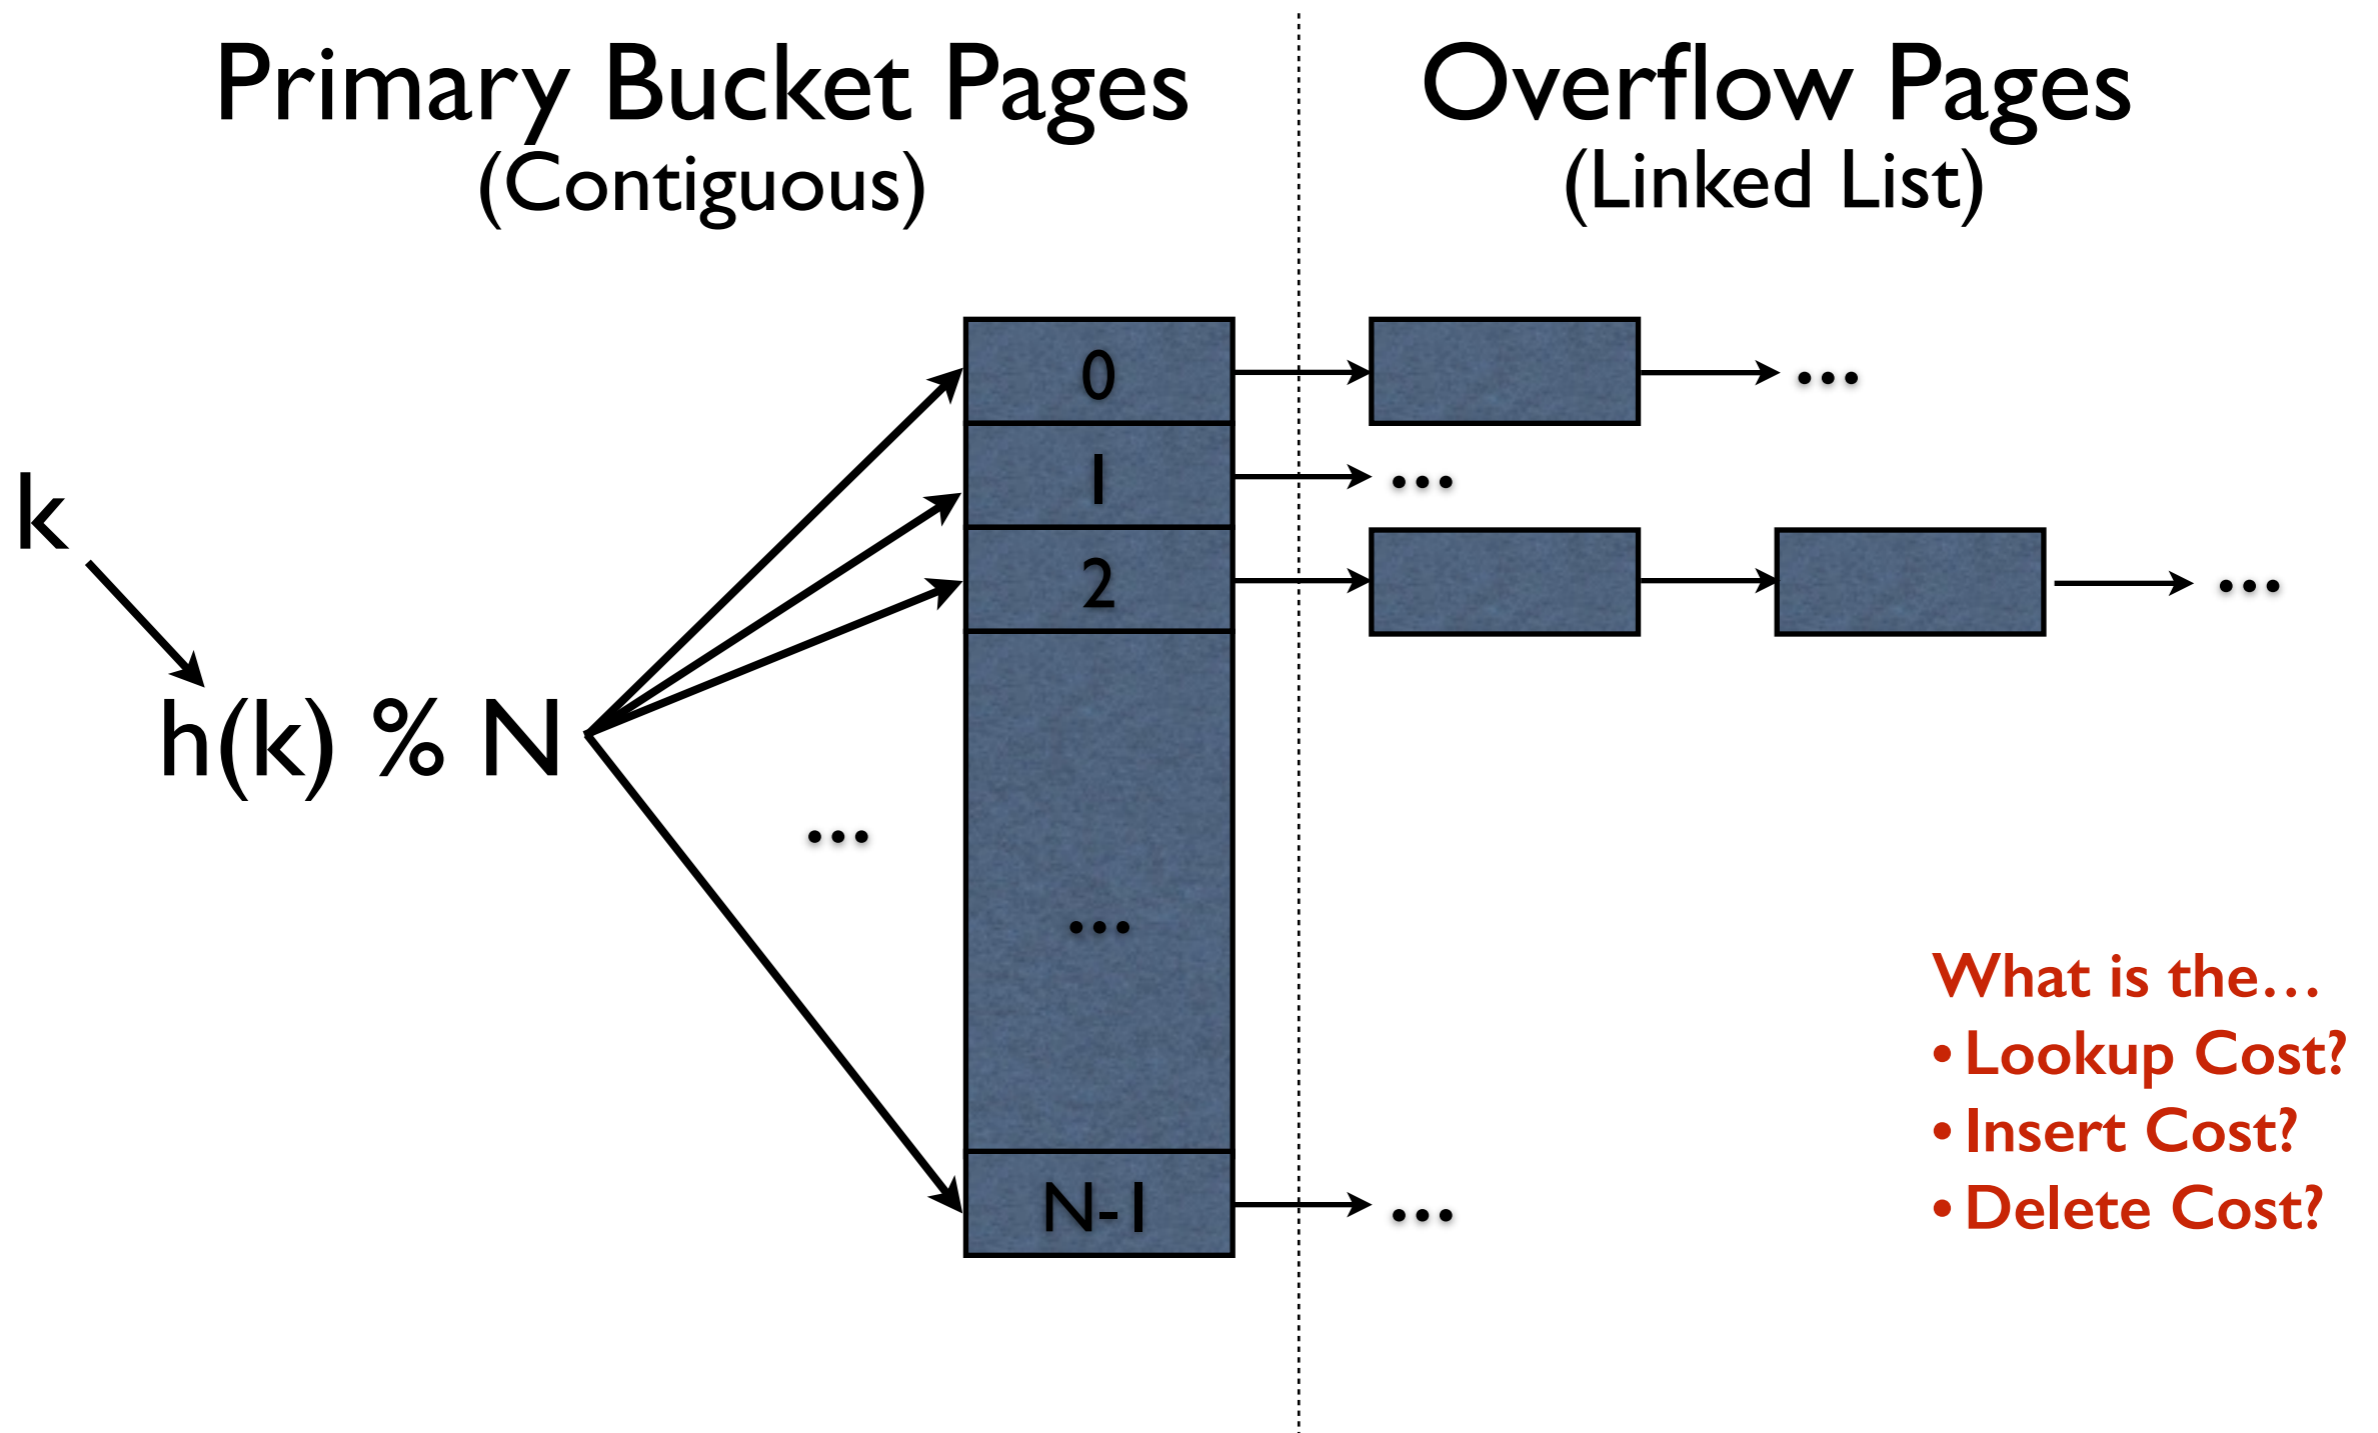

Search proceeds as in ISAM via key comparisons

Find 5.    Find 15.    Find  $[24, \infty)$

What is the...  
• Lookup Cost?  
• Insert Cost?  
• Delete Cost?

# Static Hashing

What is the...  
• Lookup Cost?  
• Insert Cost?  
• Delete Cost?

# Dynamic Hashing

- **Situation:** A bucket becomes full
  - Solution: Double the number of buckets!
  - Expensive! ( $N$  reads,  $2N$  writes)
- **Idea:** Add one level of indirection
  - A directory of pointers to (noncontiguous) bucket pages.
  - Doubling just the directory is much cheaper.
  - Can we double only the directory?

# Dynamic Hashing

Dir entries not being split  
point to the same bucket

- What is the...
- Lookup Cost?
  - Insert Cost?
  - Delete Cost?

# Which Index/Layout?

```
select
    sum(l_extendedprice*l_discount) as revenue
from
    lineitem
where
    l_shipdate >= date '[DATE]'
    and l_shipdate < date '[DATE]' + interval '1' year
    and l_discount between [DISCOUNT] - 0.01 and [DISCOUNT] + 0.01
    and l_quantity < [QUANTITY];
```

**What features are interesting?**

# Which Index/Layout?

select

```
l_orderkey,  
sum(l_extendedprice*(1-l_discount)) as revenue,  
o_orderdate,  
o_shippriority
```

from

```
customer,  
orders,  
lineitem
```

where

```
c_mktsegment = '[SEGMENT]'  
and c_custkey = o_custkey  
and l_orderkey = o_orderkey  
and o_orderdate < date '[DATE]'  
and l_shipdate > date '[DATE]'
```

group by

```
l_orderkey,  
o_orderdate,  
o_shippriority
```

order by

```
revenue desc,  
o_orderdate;
```

What features are interesting?

# Physical Layouts

# Data Organization

- How do we store data?
  - How are records represented on-disk? (Serialization)
  - How are records stored within a page?
  - How are pages organized in a file?
  - What other metadata do we need?
- Our solutions must also be persisted to disk.

# Record (Tuple) Formats

- Fixed Length Records

Record information stored in **System Catalog**

What are some advantages/disadvantages of storing records this way?

# Record (Tuple) Formats

- Delimited Records

What are some advantages/disadvantages of storing records this way?

# Record (Tuple) Formats

- Self-Describing Records

Array of Field Offsets

What are some advantages/disadvantages of storing records this way?

# Page Formats

Packed

Number of records

Unpacked, Bitmap

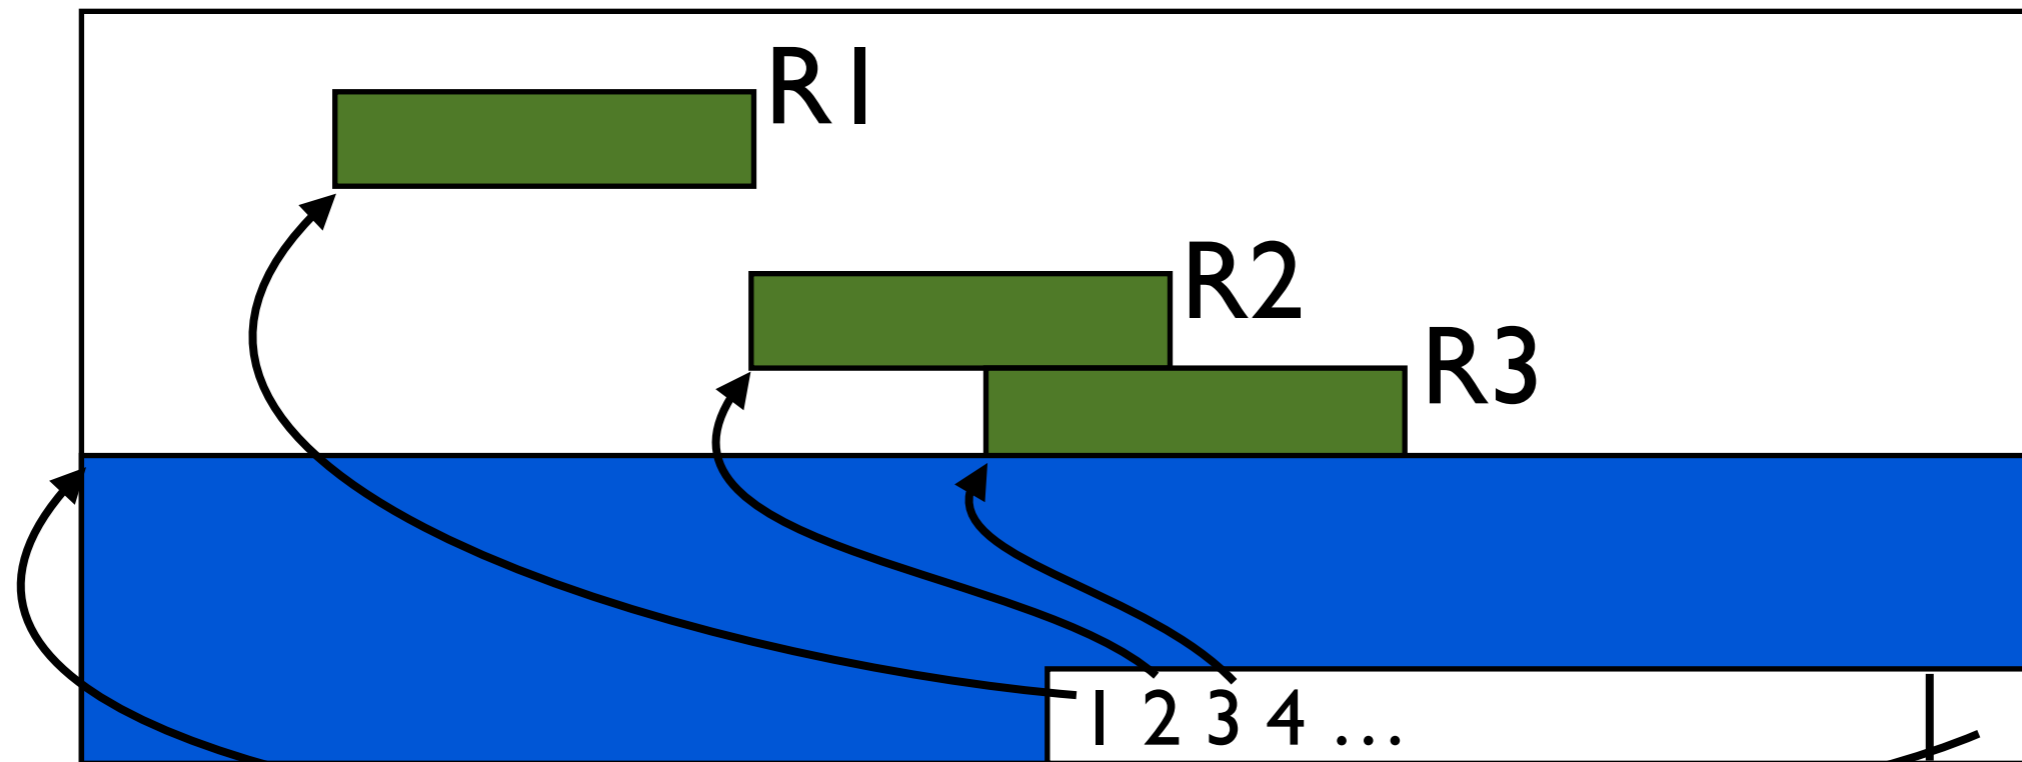

Bit array of occupied slots  
(and size of page)

What are advantages/disadvantages of these formats?

# Page Formats

## Variable Size Records

Pointer to start of free space

What are advantages/disadvantages of this format?

# Files of Records

IO is done at the Page/Block level

... but queries are done at the Record level

**File:** A collection of pages of records that must support:

Insert/Delete/Update a record

Read a record (using record ID)

Scan all records (possibly with some condition)

# Unordered (Heap) Files

Store records in no particular order

Disk pages are allocated/freed as file grows and shrinks

Support for record level operations by:

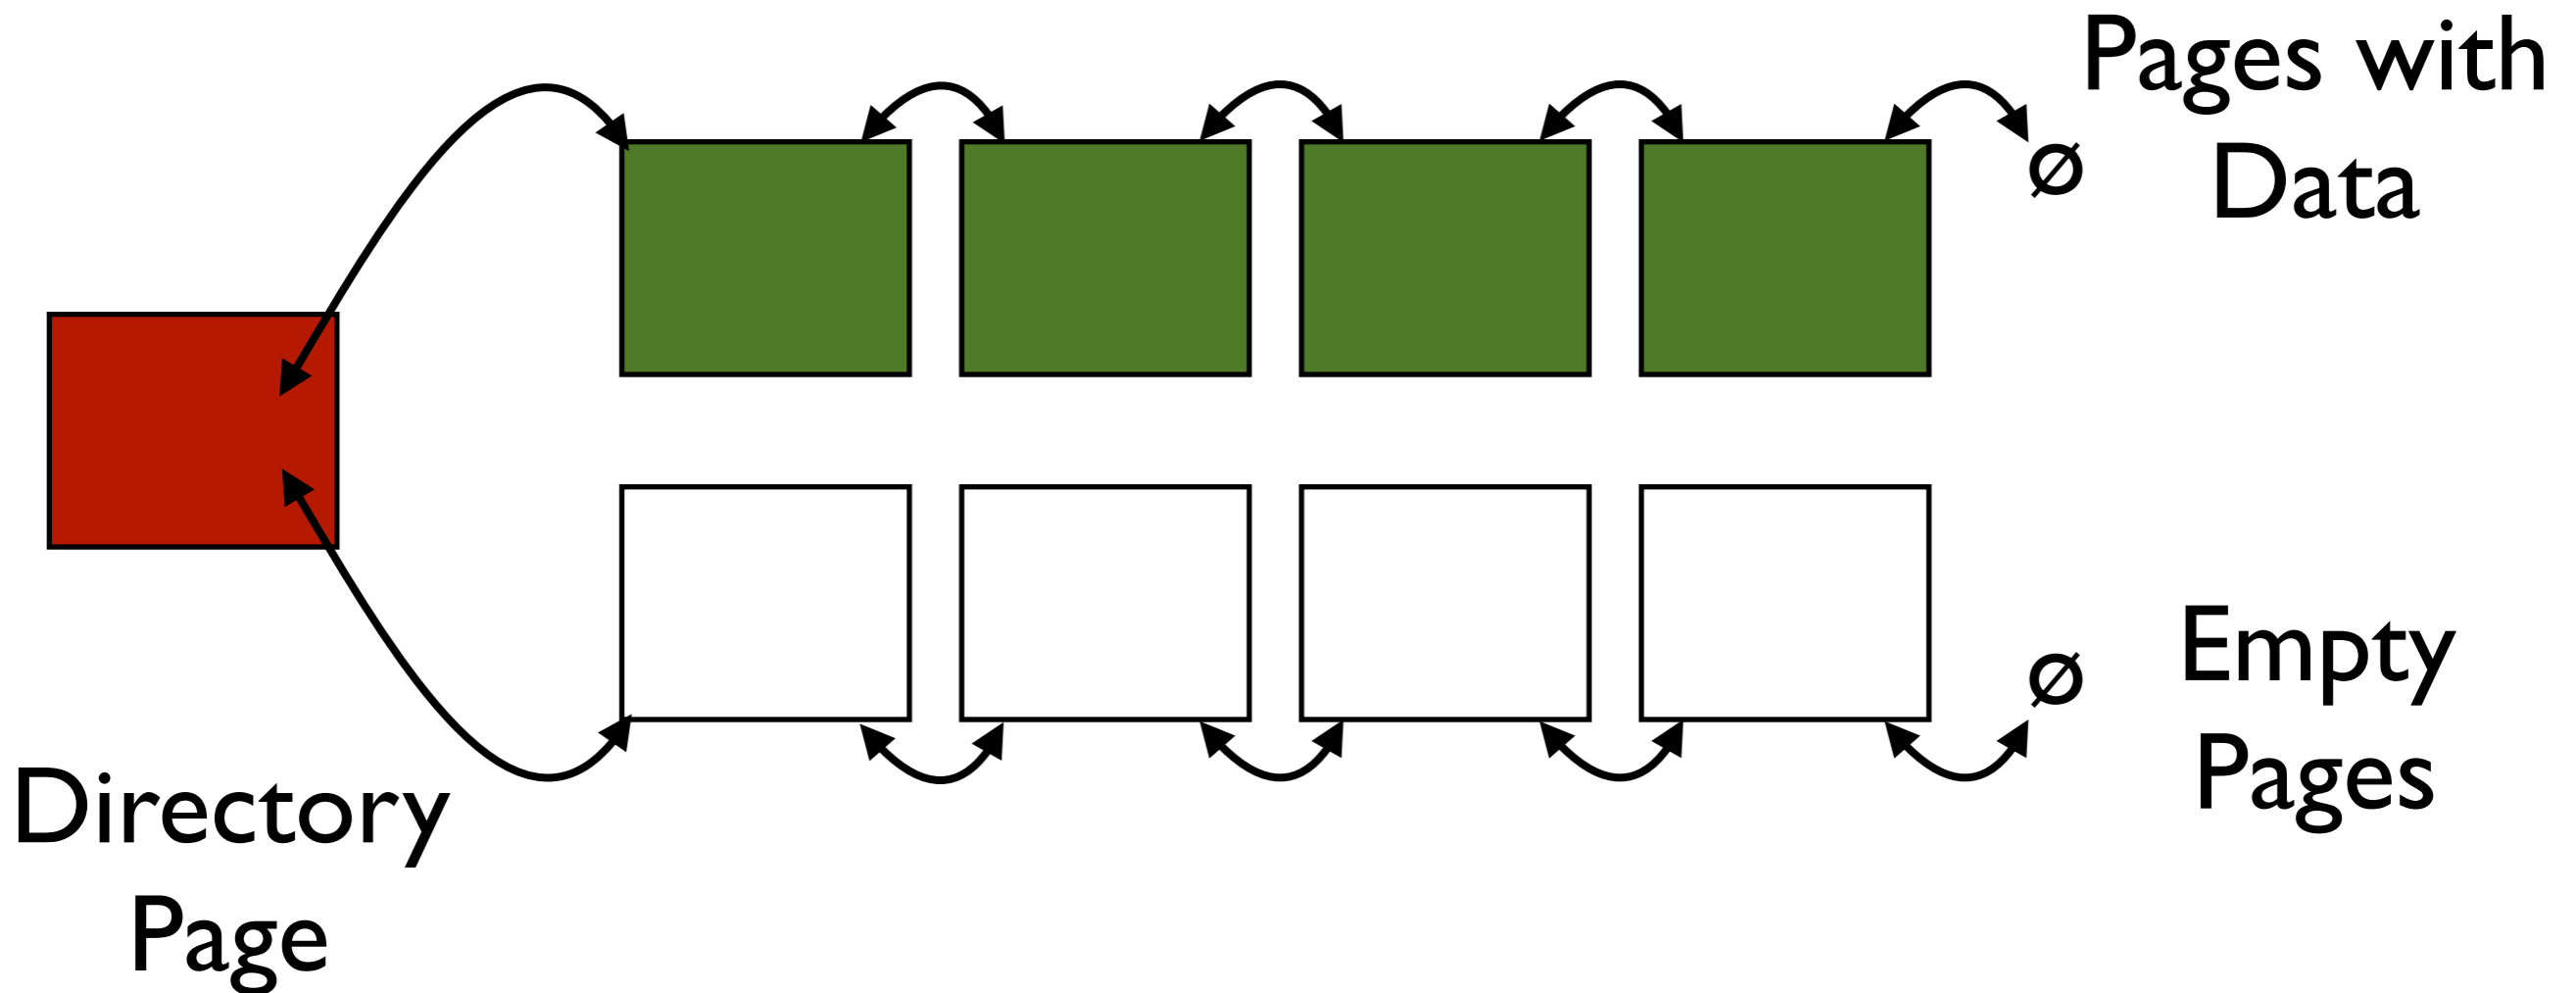

- Keeping track of pages in the file

- Keeping track of free space in each page

- Keeping track of records on each page

This data must be stored somewhere!

# Unordered (Heap) Files

Each page contains 2 pointers plus data

# Unordered (Heap) Files

Directories are a collection of pages (e.g., a linked list)

Directories point to all data pages  
(entries can include # of free pages)

What are the advantages and disadvantages of each?
